# LP335 Connection Test Unit

To be able to manufacture at low cost, it is very important to keep high quality throughout the whole process and not only assure quality at the EOL, but also at every workstation where assembly is done.

In a modern car, there are a lot of electrical consumers like LEDs, speakers, sensors, switches, outlets and so on. Those components are assembled onto parts like seats, interior door panels, interior roofs, bumpers and cockpits. If one of those sensors, switches etc. is not functioning when the car is checked at the EOL, there is often a major cost to correct it.

The LP335 CTU, Connection Test Unit has a standardized electrical interface that may be used to quality assure assembly of electrical harness. The most common method is to power up those parts that has been connected to the harness, and measure that there is a current consumption. Or measure the impedance. For the more intelligent modules connected to the harness, there are three channels CAN, LIN and Serial (RS232) that can be used. Those channels require a specific driver to be developed for each case.

To be able to connect to each harness, there must be a specific cable adaptor manufactured. LP335 includes output to control LEDs in the adaptor, Green, Yellow and Red. Those LEDs will show status to the operator during the test sequence. A sensor input is used to verify that the adaptor has been connected to the test harness.

## TECHNICAL DATA

Communication	Profinet or CAN
Connectors	8x Harting, 12 pin + PE
Power Supply	20 - 30VDC
Current Consumption	max 4A
CE	EN 61000-6-4 & EN 61000-6-2
IP	IP41
Temperature Range	0 - 50 °C
Humidity	0 - 95 % non-condensing
Dimensions	b 400 x h 450 x d130mm
Weight	-
Mounting	Wall mount
